

Estimated Price of Annual WindLock™ Protection

ROL (Rate-On-Line)

This map shows the estimated price of annual WindLock™ protection expressed as Rate-On-Line, or the percentage of annual premium to the annual contract payout limit. In this example, WindLock is indexed to annual wind-driven generation as implied from a generic power curve, triggered at P90 – the level of annual wind-driven generation exceeded 90 percent of the time – with a contract limit set at P99. The red shaded areas represent parts of the US where there is a greater likelihood of significant underproduction and hence greater potential benefit of WindLock protection, even at a relatively higher cost. Actual site-specific pricing may differ and can be structured to reach a desired cost or protection level.
